According to the state diagram shown in Figure 3, write the Verilog circuit module for this synchronous sequential circuit by state-diagram-based model. The binary assignment of the states are S_0 = 00, S_1 = 01, S_2 = 10, S_3 = 11. Assume that this circuit has an active-LOW *reset* signal which may reset the circuit to its initial state S_0 (00). The circuit module and port list should be named as Lab3_Mealy_state_diagram (output z, input x, clock, reset), and its file should be named as Lab3_Mealy_state_diagram.v.

ii. 完成此同步順序電路之設計，以 JK 正反器做為其儲存元件。根據推導出之電路圖，以 Structural model 方式撰寫其 Verilog HDL 電路模組。假設此電路圖有 reset 輸入訊號，可設定電路至初始狀態 S_0 (00)。模組名稱與 port list 請訂為 Lab3_Mealy_structural (output z, input x, clock, reset)，檔案則請命名為 Lab3_Mealy_structural.v。請注意，此電路模組中需要用到有 asynchronous reset (又稱 direct reset) 之 JK flip-flop 的電路模組，可自行撰寫或使用課本上之模組，檔案請命名為 JK_ff_AR.v。假設此 *reset* 訊號為 Active-LOW。

Complete the design of this synchronous sequential circuit by using JK flip-flops. According to the circuit diagram derived, write the Verilog circuit module for this circuit by structural model. Assume that the circuit can be reset to its initial state S_0 (00) by input signal *reset*. The circuit module and port list should be named as Lab3_Mealy_structural (output z, input x, clock, reset), and its file should be named as Lab3_Mealy_structural.v . Note that this circuit module requires to instantiate the circuit module of a JK flip-flop with *asynchronous reset*, also called as *direct reset*. You may design the JK flip-flop module by yourself or apply the module provided in the textbook. The file of the JK flip-flop should be named as JK_ff_AR.v . Assume that the *reset* signal is active-LOW.

iii. 請撰寫一測試模組來完整測試上述兩個電路模組。請將此測試模組命名為 t_Lab3_Mealy，檔案則請命名為 t_Lab3_Mealy.v。
